Moving one step forward for website, added CSS to make its look better.

Branding Guide vs Final Project:

The theme of "EAT & REPEAT" website was created to be warm and user friendly which finally appears to be same as the guide because of the usage of the beige bisque and brown colour. For the identification placed the idea was to place logo at the top of the webpage which finally was placed on the sides of the title. The typography was assumed to be classic, so fonts used were Sanserif, Times New Roman etc. Going further the text was aligned and applied paddings and margins to text box and tables. Final project is clean, classic, readable and user friendly.

Results from testing and Changes Made:

Used Google Chroma and Apple's Safari for testing which worked well. Enabled the option of **go live** from the visual studio code helps me a lot in modifying my website. The live view of website not only helps me in modifying it but also learnt a lot. Beginning with the alignment, live testing the website, helps me to figure out alignment where the text appears good. Also, the addition of border radius to the text boxes and tables is also the result of testing. Made so many changes while testing such as the background colour for text boxes and tables, also the fonts for the headings and the paragraph texts, alignment and styling of the elements of the webpage is the result of the testing, because while going with live view testing the things came in mind can be implemented easily.

Feedback Session:

One of my friends is in web design, I took feedback from him. He helped in taking out the errors which were the obstacles for running the background such as I used p1, p2, p3 for each text body which was inconsistent, so I used the same for each of them which is 'p'. He recommended certain changes for the padding and margins which I made for its better interface. Adjusted styling for the texts and fonts. Furthermore, previously the footer navigation bar's padding was only left side, so he suggested me to place it on right side also. He appreciated my efforts anf was impressed from the interface. Overall, I showed to my instructor which enhanced my courage because it was prepared well.

Iteration:

Firstly, the simple HTML webpage was running on the site. Then added CSS to it for its better looks. Added colours, fonts, borders, backgrounds etc. Then worked on layout, added flexbox as a footer navigation bar. Finally, Fixed and organized the CSS and HTML files.
